Meal Planning Guide via Radix Nutrition Product Range

The information provided in this guide can help you to create an effective nutrition plan for your next big day, heavy training week or expedition.

Use the calorie and macronutrient guide to help set targets for your day and fill those targets with the Radix Nutrition Product Range as part of a complete nutritional strategy.

Protein

Why Is It Important?

The primary building blocks for our bodies. Adequate intake is important to build and maintain muscle.

Daily Recommendations

Recommended daily intake for active individuals is between 1.4-2.2g per kg bodyweight, with intensive training increasing demand.

Example

For a 70 kilogram individual, 1.4g of protein per kg bodyweight would equal 98 grams of protein per day.

$$1.4g \times 70kg = 98g \text{ protein}$$

Fats

Why Is It Important?

A good source of energy, particularly at low intensities. Fats have more calories per gram than carbs and protein, making them the lightest option to increase your energy intake.

Daily Recommendations

Usually, around 20-35% of total daily calories should come from fat. In some cases, such as for ketogenic diets and high-energy demand, calories from fat can increase to up to 80%.

Example

For someone with a daily calorie intake of 3000 kcal, 20% of their daily calories is 600 kcal, which translates to 67g of fat (as there are 9 calories per gram of fat).

$$20\% \text{ of } 3000\text{kcal} = 600\text{kcal}$$

$$600\text{kcal} \div 9\text{kcal} = 67\text{g fat}$$

Carbs

Why Is It Important?

The most effective energy source for fuelling intense activity and recovering from hard training sessions. Less important for general health and low-intensity exercise.

Daily Recommendations

Intake varies depending on the frequency and intensity of exercise. For active individuals, between 5-8g per kg bodyweight is recommended for moderate training, and up to 8-12g per kg bodyweight for prolonged intense exercise.

Example

For a 70 kilogram individual, 5g of carbs per kg bodyweight would equal 350 grams of carbs per day.

$$5g \times 70kg = 350g \text{ carbs}$$
